

JoyDew Call - Moish to meet with Olga and her team

• May 28, 2026, 09:31 AM - 10:32 AM • okubli@modus-soft.com • Google Meet

Marina Yudenkova • 00:01

Moi.

Moish Tov • 00:02

Good morning.

Marina Yudenkova • 00:05

How are you?

Moish Tov • 00:05

I'm good. How are you?

Marina Yudenkova • 00:09

Good as well. Moi, let me introduce Victoria, our new business analyst. I've already told you about her. Probably I will repeat myself, but Victoria, she has extensive experience in the business analysis and specifically in healthcare domain projects. What we've already— hello— done, I've passed all gathered through our previous calls to Victoria and Probably I will pass the stage to her and she will give you the insights on where we are now and how we are going to move forward.

Viktoria Galas • 01:07

Hello, nice to meet you. My name is Victoria and I'm located in Canada, so I'm in the same time zone with you and Olha. I've been working as a business analyst in IT and especially in healthcare for quite a time, more than 8 years I believe. Um, yep, as Marina mentioned, she shared with me all their recordings and all the artifacts already created, which are amazing. There are a lot of details. What I would like to help us with and team with is to move forward with a, with a project, with a program, and, and with the product. There are a lot of pieces around, so I try to, to put everything together and first of all create the product vision document.

Viktoria Galas • 02:07

Which we can go through this document, or I can just share the— share it with you so you can, uh, you, you can, you can read it. And if you have any comments, uh, send it, uh, send your feedback. Uh, there are also the prototype, uh, in place, and I must say that's, that's a great product and that's a great idea, uh, you're working on. I personally, my son has ADHD and like very not as severe, but from the early, early ages he has some. Uh, he didn't get oxygen when he didn't breathe when he was born, so it was a— it was— his brain was impacted. And, uh, I lived in fear for, for, for a long time. He didn't speak for some, uh, for until he was 3, and, uh, that was the.

Viktoria Galas • 03:23

That was, uh, his autism wasn't approved. And actually Ukraine is not very good with, uh, with such diagnosis and, um, yeah, and things. But probably I would love to have such type of application that can help me to understand where to go, want to do with my child. And especially now I moved to to another country, a new country. And also, so that's a great idea. And that's, um, uh, I, uh, I just love what, what are you doing. And, uh, I'm happy to help with everything because I, as a mother, uh, with, uh, I don't even know how to say, with this, uh, extraordinary child, I, I know how, how is important to have this Yeah, so thank you so much for, for this initiative.

Viktoria Galas • 04:26

And from my side, I will, I will do my best to make it happen. And so this product will see the— will go live, and people can — people like me can benefit from it. Yeah, I will quickly show you If you have any questions and/or any comments, please feel free to interrupt me. Um, just, I need to give the, uh, permission.

Moish Tov • 05:00

Where are you from in Canada?

Viktoria Galas • 05:02

Uh, I'm currently live in London, Ontario. It's in between Detroit and Toronto. Yeah, I might, I might quit the meeting for a second and then come back because I, in order to be able to share my screen. So I'll be back, please. Yeah, please give me permission to enter the room.

Olga Kubli • 05:38

Hi, Moishe. Hi, Marina.

Moish Tov • 05:41

Oh, good. How are you?

Olga Kubli • 05:43

I'm good. You? Oh, cool. I'm back.

Moish Tov • 05:50

It's Thursday.

Viktoria Galas • 05:53

Yeah, that was very fast. Okay. So I conducted the analysis of all the information. And please apologize if I'm gonna ask questions that already were discussed. I'm still new and try to figure out everything what's happening, so my apologies in advance. So I created the product vision document, and the product vision document includes the, uh, the product vision statement, what product is and what we try to what, what are the problem, uh, we try to solve, and also what the app is not, because we need to, um, to make a huge stress on, um,. On the statement that we are not the medical device, so we won't go under the FDA, uh, governance, uh, right?

Viktoria Galas • 06:58

So we need to be very careful with that. That's why I included this part into this vision document. So whatever, whoever gonna read this, this will understand what, what we are envisioning. I will send it to your review so you can say Am I right? Am I not right? I tried to capture everything that was discussed during the previous meeting. However, again, it was only the recording and I might miss something.

Viktoria Galas • 07:30

Uh, the main project objectives, and here we have, uh, the, uh, the first object, uh, is to help families navigate complex, uh, systems and, uh, GPS-like guidance layer, uh, that's a part of the application, uh, create centralized individual profile preserve care knowledge for future caregivers, support daily life management, provide event and crisis guidelines, connect families to local service and events, and use, use integration instead of rebuilding existing tools, and keep compliance and privacy risk visible. So we should, should be very careful about that. Especially when we're integrating with, um, we want to integrate with EMR systems, right, or include some integration and AI processing. Target— our

target groups, the target groups are the age-based. So we have young children and main users here, they are parents, guardians, babysitters, early intervention providers, teachers, therapists. I won't stop in very details on each page, each chapter, but here we also have the context. What, what we try to achieve and what is the context for this, for this specific group of people, of kids.

Viktoria Galas • 09:20

What are the product primary needs? What they— we envision we can— our product can give them. The feature that will be useful on this a particular period of time. And also some examples of this GPS prompt. And then the teenage years, uh, the same— the parents, guardians, school support team, therapists, coaches, or mentors, and the adults. What I did not include into the, into the main users, because I never heard this within the conversation, and I want to ask to you, the person inspecting Spectrum themselves, are we targeting to, to them as users of our application or no?

Moish Tov • 10:26

We target only families.

Viktoria Galas • 10:29

Only, only families.

Moish Tov • 10:30

Yes, and we're not targeting, uh,. Provider, teacher, therapist. This is not for them, it is just for the families.

Viktoria Galas • 10:47

Okay, why I include teachers, for example, this might be useful for them because we, within the application, we are building the profile of of the person on the spectrum. And there are a lot of useful information and some tips and tricks that can help to handle, for example, the crisis moments. Or I would say we not only— we should not only focus on the negative but also on the positive. What are the strengths of this of this person and via their permission. So. Teacher can have access to some of the information about this student, which gonna be updated, which gonna be more up to date than the reports and education, individual educational plan that are provided. Because my son is on the individual education plan as well, and I read this every year at the same phrases, nothing new.

Viktoria Galas • 12:10

Nothing new. So it's just, you know, checkmark. So, um, it, uh, I'm not saying that, uh, this is something we need to build right away, but there's something we should not, uh, we should consider probably future stages, right? In a year, in a two, but, um, at least it's my recommendation, um keep, keep our users option broader.

Moish Tov • 12:52

Yep. One of the fundamental problems that we try to solve is families navigate the system. The system is not helpful, and in many cases the way that the family want to, to proceed and the way that the system is contradicting. So The provider, the teacher, the therapist, uh,. Are not— if I said nicely, they're not— the goal is not to help.

Viktoria Galas • 13:54

I feel you. When we, when we just moved to Canada, it wasn't easy to find the child not the psychologist, psychiatric, to do the assessment. You either have—.

Moish Tov • 14:20

The psychiatrist will be on the—.

Viktoria Galas • 14:26

on the marketplace but the psychiatrist is not a user of the system uh yep so um let them uh take into uh take a look into the um personas so probably that's that will be easy to uh to see though uh our key personas of the uh So personas is a bit different than the user. We just envision who might benefit from the application.

Moish Tov • 15:17

I said that this is wishful thinking, but in my life, they— the system or the application we built is to overcome the issues that these guys are creating. So they cannot be part of the users because they're going to interfere with the process. It's like a great application for, uh, helping Ukrainian people in Kiev to know where they have to go to the shelters. And to give the same application to the ration. So, the providers are not— most of them don't care, or they care about something. We want to show all the time for the families, what are the options that they have. So, educate the family, that's the main things.

Moish Tov • 16:43

The providers don't want to— educated, they want them to go with what the provider is doing. So clearly this is, application is for the families, and if the family want to get something from the teacher, we have to create this link, but clearly, We don't want to have the, uh, uh, what they call the system users of the, uh, the application.

Viktoria Galas • 17:25

Yep. Oh, okay, got it. So I, I'm going to remove, uh, I'm not sure if we have. Yeah, so as a persona number 6, I do have a service provider, but they are mostly the users of the marketplace, so they can advertise, advertise their services.

Moish Tov • 17:57

Yes. Yeah, but they're not users, they are promoting or. Services.

Viktoria Galas • 18:09

Uh, okay, they are promoting services. Um, um, so I also added the persona as a technical support and administrator because on the early stages, uh, we need someone to evaluate and, uh, to define if it's a real provider, if it's not a scam. We, we don't want to give them ability to post the advertising without the sort of investigation, because we, at least at the beginning, it should be manually and went through some, I don't know, verification.

Marina Yudenkova • 18:56

Someone who verifies.

Viktoria Galas • 18:58

Yeah, someone who verified that this is a real person. Later in the future, I'm not saying right away, but probably we can build some self-service so they can post the information by themselves, like, like they, like people are doing for Kijiji or the marketplace or whatever. But from our pers— from the product perspective, they still have personas. And user are the people who interact with the application. So even it's only the one touch, but we— they still in our, uh, in our cycle, in our target. Yep, it was very important at the beginning of the. Building the product and envisioning the product to identify everyone who, however, will interact with, uh, with the system.

Moish Tov • 20:03

Um, let's leave the marketplace aside. The. The priorities are create the profile and everything that is needed to manage the life of the individual that has either autism, ADHD. The idea about the marketplace is that actually the one that will be get the provider are the families. And they will, they will be the one that are evaluating and give them 1 star, 2 stars, or 5

stars. So, it will come from the families. It's not that we are going to look to see who are the psychiatrist or the teacher in North Carolina.

Moish Tov • 21:24

We don't know. So that information will come from family that says, "Okay, I know this person, I want to put them on the marketplace." But let's leave this, the marketplace, The marketplace, there are multiple applications that are already doing it. We have to focus on the, the two other portions, because they are driving everything. That is one thing. Second, you, you broke it down by age, the person, like your child and Sam's child. He's not broken into pieces. So this application is individual-centric for all his life.

Viktoria Galas • 22:31

Uh, that's, that's right, that's correct. Uh, however, on different age stages there are different problem, uh, different, uh, items and question that, for example, you will ask GPS when your kid is 5 years old, you won't ask when it is 13 years old.

Moish Tov • 22:58

True. The, the main challenge of parents. Started actually in late age. So the GPS will tell you at age 10 what you have to do and prepare for the age 18 and age 21. The GPS will tell you when you get a diagnosis What the best diagnosis that you want to have for life. Diagnosis is very difficult to change, and there are diagnosis that you don't want to have, and there are diagnosis that give you more services, and that is life. So the, the all of you need to be about the individual on the lifespan.

Viktoria Galas • 24:00

That's, that's true. So this document is a comprehensive view on everything. If we, uh, so that's the highest level, that's the highest level vision. Now we need to understand what do you need, uh, in order to go to the investors. What prototype, what flows, uh, what, um, what features First, and break down all this vision into the phases, because if we're gonna start to implement everything, that's gonna take years. That's my proposal is—.

Moish Tov • 24:47

We don't want to implement anything, but we want to show that GPS— let's say differently. We want to show that the need for parent education start as early as possible. Mm-hmm. And it is helping them all the time while they're moving forward. Mm-hmm. The market today focus on early, early age, uh, for whatever reasons, uh, and parents being uninformed.

Olga Kubli • 25:40

Mhm.

Moish Tov • 25:43

So we want to show to Whoever it is, we want to show that some individual at the age of 3, only being diagnosed, this system is, the application is helping the parents to go through the process of diagnosis, but it's going with him until the age of 65. And the question that they have to ask are broken into the category that we said. But what we want to show is that there is a GPS or navigator that's helping you to say, okay, I know that my son is 8 and I need to think about what I'm doing this year, next year. But the thing that you want to think about the age of 8 is going to help you at the age of 16 26 and 56. That's what we want to show the GPS is doing.

Viktoria Galas • 26:49

Um, got it. So, um,. If we take a look into this application from the side of these three main core, uh, core modules, which is profile, GPS, and marketplace, uh, on your opinion, for the MVP, uh, what should we focus on? Definitely profile and GPS. What I, what I hear, a marketplace Is this crucial to include into the MVP scope?

Moish Tov • 27:28

It has to have some samples. And yes, we have to think about the process, how they're getting in. But the way that we think about it right now, that the. anyone that go to the marketplace yes it need to be verified that true but we want to get ranking from the families so what most important is the first the first two on the marketplace I would say that we want to show different type of events that's happening. And do you have it in your document?

Viktoria Galas • 28:33

Uh, and that's more the high level. I will show you, I have the other document. I will reshare my screen where I put together, I would say, recommended prototype scope. So we can take a look there. It's more. Yeah, uh-huh, uh, because we need to build a prototype as soon as possible, create some, create the presentation which show our vision, the problem statement, how we're going to help, uh, how the appli, our solution resolves those problems, uh, some, uh, revenue stream model right, and the prototype. And this is something we need to do ASAP and then focus on the, on the scope of the phases.

Viktoria Galas • 29:28

Because I have— I would recommend that the MVP implementation should not take longer than 6 months. In 6 months, we should have the, uh, some, uh, something tangible and something that we, uh, that, uh, we can already go, uh, on, uh, uh, into in market with something. And, uh, while we are getting feedbacks and promoting the application, we will be working on the next phases. Right, so again, everything depends on the budget and how many people we can involve into the implementation. That's why that's always 3 dimensions. We have scope, we have time, and we have a budget. What I want to— what I'm aiming to do is to speed up go-to-market process.

Viktoria Galas • 30:38

So we won't be implementing the full application and wait when everything will be ready, but we need to focus on must-have in the application and go with it into the MVP. Then something that we should have, but that can be the later stages, right? And, and then based on the market reaction, market demand, user feedbacks, etc., we can adding more and more functionality or removing what, what is already is happened. So we need prototype first. And I know that there is something already exist last week, last two weeks, sometimes ago it was presented. And I would like to know, is this enough or you would like to add something else to the prototype? And then, and then go with the implementation phases.

Moish Tov • 31:43

I think that last time we spoke about what. what we want to add to the prototype that's being created.

Olga Kubli • 32:03

Go, Marina, go.

Marina Yudenkova • 32:04

I think it was the very first raw version of the— it was not the prototype, but it was just the, let's call them wireframes, clickable wireframes that were presented by our designer to Moishe just to verify the concept. And let's say how the general layout looked like, how Moishe felt about it, and Yeah, we had a chance to get the very first feedback on the changes in the structure and layout, what needs to be added, etc. But yeah, it's not yet done. Definitely my vision was that we will move forward in parallel. So yes, Victoria, you are going to work on the— your focus will be on the

requirements and MVP. But it will strengthen the design and the prototype creation because design and requirements cannot live separately. Yeah, but yeah, there is definitely something more work to do with the prototype.

Marina Yudenkova • 33:17

It's not the final, finalized yet. Maybe I didn't mention that.

Viktoria Galas • 33:24

Yeah. Sorry, the question to Moishe, uh, should it be— so I, I, I do not envision some backend for the prototype. It should be something clickable, and it can be the Figma version or some, some other version. I agree with the statement. Okay, good. Uh, uh,. What— again, I was brainstorming only based on the recordings I had.

Viktoria Galas • 34:04

If, if, uh, if there are any comments, feel free to add them. We definitely must have the individual profile. And, uh, question, uh, here, uh, how deep do— so, um, How, um, how I see that, that we need to show, uh, profiles for, for, uh, this age, uh, three time, um, this, uh, three age groups. So profile for the young, profile for, uh, for the teenager, and profile for, for adult. Because I also believe that there are some difference and some different information within each profile. And make strengths on those difference. Of course, the age, the diagnosis, they, they're all gonna have something in common, but for the prototype, we need to show some basic information and plus how, how those individuals' profile are different depend on the age.

Viktoria Galas • 35:18

The fields can exist everywhere. However, some field will have more benefit when a person is adult rather than when it is a child.

Moish Tov • 35:38

The profile is built up and you continue to update it. There are things that you want to keep, I think, that might be less important as you grow. So what we want to show, we want to show Either one individual in different ages and how the profile is changing or updating and how the. How the GPS is helping you, and a few samples of how the marketplace is helping.

Viktoria Galas • 36:30

Mm-hmm.

Moish Tov • 36:36

The one point that is important to remember is that The investor that I'm talking to, the kids are between the age of 18 to — I would say between the age of 4 to the age of 20, 21. That the investors, but they need to learn that and some of them know that, but they need to know about the future. So the prototype needs to show either one individual in different ages, or 3 or 4 individuals, each one in different age, and how we How the profile is update for the age, how the GPS is helping you on that age. But it's really important to educate the parents that the kids going to live most of the life as adult.

Viktoria Galas • 38:09

Got it. For the GPS questions, they can go in different layers. How deep should we show? Or it's just an example of couple of just main questions and do not go very deep.

Moish Tov • 38:31

I think that last time we said that we want to have 2 or 3 levels?

Viktoria Galas • 38:39

3 Levels, I believe.

Marina Yudenkova • 38:40

3 Levels and 1, uh, I mean, 1 list of those nested, 3 nested levels for a prototype. I mean, we will get this information from Moish.

Moish Tov • 38:59

The 4th level is AI.

Viktoria Galas • 39:06

Uh, yeah, for the prototype, um, I would say we will go just with some explanation and envision. We won't be integrated with something. I'm sorry, I messed up.

Marina Yudenkova • 39:18

Excuse me? I said, uh, sorry for interrupting, I messed up.

Viktoria Galas • 39:26

No, no, you, you're good, you're good. Please, please go ahead because you haven't, uh, you interact a lot with emotions, you have more contact that I do. So no worries at all. We have all the team, the group, and help me to brainstorm. Absolutely. Yep. Daily routine.

Viktoria Galas • 39:52

Is this something we want to add into the prototype or we are good just the profile with the GPS?

Moish Tov • 40:01

Daily routine is one of the most important things.

Viktoria Galas • 40:04

Okay, uh, good. Daily routine, uh. Good. I'm making comments right, right away. Uh, okay, so, uh, the third, uh, the fifth level is, is AI. Again, with, uh, AI, we need to be very careful, and we will need to think about, um, that AI should not diagnose, should not, uh, the decision, decision should be on the parent side always.

Moish Tov • 40:59

The AI is, uh, the LLM of the AI is the profile. And whatever he knows about the diagnosis and the market. He doesn't do any decisions that are medical, but it helped the parents to say, "Okay, I need to do something. I need to be ready for the IP meeting.". What do I have to do in certain state or certain place to be prepared for that? So the AI can help the parent to say, okay, I need to go to the IEP, I know the question that they want to ask. And the AI will give the parent, based on that questions, uh, options that he want— they need to know.

Moish Tov • 42:15

And the only idea is the main problem that we attaching, and we have to— and that is the most important thing that we want to show to the parents. To the investors is that the parents, uh, the parents are very busy, uh, being, uh, taking care of the kids, don't have a lot of time, and the system playing against them, not with them, it's against them. The motive of the system is money, how to make more money on your child. And the motive of the family is, is how to get the best quality of life for the child. Two contradicting motives. And that's what we want to show in the prototype.

Viktoria Galas • 43:30

Yeah, thank you for sharing that. That's very important input.

Moish Tov • 43:36

I have in 15 minutes a meeting with the head of the government agency that should give services for all adults on the spectrum. He couldn't care less about quality of life. Yeah, just about keeping his people in place. And so that, that's the reason that we're doing it.

Viktoria Galas • 44:13

Absolutely, absolutely. That's— yeah, that's true.

Moish Tov • 44:21

and not too many investors are familiar with this so we have to show them and we have to take examples that are simple examples but examples that they can see that's a good example diagnosis okay there is one diagnosis that for sure you don't want to have to have a kid and this is intellectual disabilities you don't want to have it okay it is going to kill your child for life and the other diagnoses that are not like that so at least the parent knows okay i have options for multiple diagnosis then the question is okay the question that the the parent should know know, that he has to ask, which today he doesn't know, is which diagnosis, and I talk about the diagnosis from the book, which one will optimize or maximize the services for my child for life.

Viktoria Galas • 45:55

Got it, got it.

Moish Tov • 45:56

And when the system will say, which diagnosis will allow me to make more money on your child for life? So this is two contradicting things, and that's what we try to show.

Viktoria Galas • 46:12

Yeah, that's, that's very valuable inputs.

Moish Tov • 46:16

Yes, and the diagnosis is gone with you for life.

Olga Kubli • 46:20

Mm-hmm.

Moish Tov • 46:22

On the age of 21 in U.S., if you want to get services, whatever diagnosis you received when you was 3 will determine what kind of services you get. When we have a 3-year-old child, we don't really think about the age of 21. We don't. We think about tomorrow.

Viktoria Galas • 46:50

Yeah, we're trying to handle it today. That's overwhelming. I understand.

Moish Tov • 46:58

We try to survive. So the parents are in survival mode all the time. And this system has to help them to manage. So the daily routine is very important because I need to know if I give medication on that hour or not, what time they're going to have breakfast and lunch, if they go to school or go to a camp or go to therapy. That is, all of this will be part of the first module, which is, "How do I manage the life?" Okay?

Marina Yudenkova • 47:41

Okay.

Moish Tov • 47:43

So, it is very important, it need to be very easy to use, but it is—. If you look into the medical side, if you decide either not to give medication or to give medication, we don't tell you if this is good or bad. We just tell you, you have the option. Okay, whatever option you choose need to be on the profile. So you know it, and if you decide to change it at the age of 12, or the age of 20, or the age of 28, that's fine. And that's coming actually for one point that you said that we don't want to say, and this is predicting medical. About 70% of people on the spectrum will have more than 3 other medical conditions.

Viktoria Galas • 49:07

Yeah, yeah.

Moish Tov • 49:09

I will give you one example that is a simple example. This is seizures. Mm-hmm. You have 70 to 75% that your kid will have seizure in puberty time. So we don't predict it, but we're saying, okay, it is, uh, it is what it is, and there is a way to deal with this. You don't have to panic. Fine.

Moish Tov • 49:44

That's all you have to do, that you have to think. And we're not predicting that your child has it, we just said, okay, it is—might happen.

Viktoria Galas • 49:55

Yeah, yeah, uh, yeah, I, I understand this. I had the same situation with my son, so except of ADHD, he has severe audiology, uh, problems.

Moish Tov • 50:09

Yes.

Viktoria Galas • 50:10

Yeah, so it's a support diagnosis. Yeah, and I, I never, uh, even think about that, but yeah, this always comes with something.

Moish Tov • 50:24

Or, if you can know, my sons are non-speaking. They do have a Parkinson's speech. You have to have, you want to have this diagnosis. Because if you have a diagnosis that you have Parkinson's speech or any other audiology, audiology—. Problem, if you want to optimize services, you want it to be diagnosed and put on the— on the medical record of your— of the child. Mm-hmm. A lot of parents just don't know it, and they don't do it because they don't know.

Moish Tov • 51:14

But later on, if you are non-speaking, when you go to school, the school have to give you by law some help with a non-speaking child. Partially speaking. Yep. It is not that we predict that it will be, but as you said, your child has delay in language. Delay in language is— can be nothing. And they will start to talk at the age of 3 or 4 and everything is fine. Or if it is something like apraxia of speech, that cannot be fixed.

Moish Tov • 52:19

So the system is helping you with that by telling you, okay, this is the question that you have to ask, at what time, okay? Delay of language until the age of 3 or 4, fine, okay, it's happening to a lot of kids, not a big deal, but you have to pay attention to it. There are different ways to pay attention with it, but this is what the profile needs to show, as a GPS. So what we want to show in the demo, the product that we do, we want to show examples for medical things, legal, we broke it down to different types of categories. All of this information that's coming from the medical need to be— you went to a doctor and you had a meeting and the meeting said XYZ, need to be added to the profile easily. So you know that you met with the doctor. Now if you met a doctor at the age of 3, at the age of 18, not really relevant.

Moish Tov • 53:45

So we have to think about it, but at least at the beginning it is the, the profile. And I don't know if this is the right word to do it, to call it, but managing the life, uh, just need to have all the information that you need in one place.

Viktoria Galas • 54:07

Okay, okay, got it. All right, um, that, that's why I, um, I, uh, include, uh, this adult future care, uh, preview, uh, as a separate, uh, section, I would say, within the individual profile. To show how the application can help to navigate services, housing, legal, financial need.

Moish Tov • 54:44

Yeah.

Viktoria Galas • 54:46

Yeah. Good.

Moish Tov • 54:49

Anyway, it's 10:26, and I have to apologize. I have 4 minutes. What is the next steps that you— we have to take from here?

Viktoria Galas • 55:07

The next steps, I will prepare the prototype flows, right, and think about the details, what, what should be shown in the individual profile, daily routine, etc., etc. So flows and scenarios for the prototype I, I probably will send it to you, or we can meet, uh, in our time zone. I mean, later, not only in the morning, just to review, um, and then share that with, uh, with the designer who will be working on this prototype. And if you need help with the presentation, preparing the presentation for investor, I believe we can help with that too.

Moish Tov • 56:00

Yeah, so I think that we should— last time we saw the first version of the prototype, it was a good start, and there was some comments about what we want to do. So I think we have to take the prototype that we have, a good start, and just work over there, the scenario that need to be presented to investor that they can see. What are we building?

Viktoria Galas • 56:39

Yep, that's true. That's, uh, uh, I will work on those scenarios and I will send you different options for your review so, uh, we can align on the scope of the prototype and just forward it to the implementation teams while we will be discussing, uh, the details and the scope of the MVP.

Moish Tov • 57:04

What is MVP?

Viktoria Galas • 57:06

Minimum Valuable Product. Minimum, minimum valuable product that can go to market and that users can start working with. It can be— it brings value and benefits to the user. But yeah, it's no longer a prototype, it's, it's a product. It's a product. However, it does not include everything from our vision, but the main must-have Thanks.

Moish Tov • 57:36

Okay. Uh. I want to go to investors for pre-seed investors, pre-seed and seed. For them, I need to show a prototype. I don't need to show the MVP. They need to understand the How the product is addressing the problem. The rest of it is on the business side, business plan and pitch deck that need to be updated.

Marina Yudenkova • 58:28

Yeah, but your business plan must include the cost, how much, let's say, this first MVP version will cost to investors and without requirements, yeah, it will be impossible to replicate for you. So that is why Victoria is focusing on prototype scope first of all. And the second point is—.

Viktoria Galas • 58:56

Let's call it the first version, the first version, first stage, first version of the product. We know that you have to run. We won't take any longer of your time.

Moish Tov • 59:14

Okay, thank you so much. Victoria, just shoot me an email, you have my email, if you have any questions. Sure. We have, so we can, based on the discussion we had so far, on the work that Marina did and the prototype that we saw last meeting, we can move forward faster than 6 months.

Olga Kubli • 59:50

Yeah, 6 months it was for MVP. It wasn't for prototype.

Viktoria Galas • 59:56

No, no, no, no. 6 Months is for the first version, fully go-to-market version. Prototype, it won't take so long.

Olga Kubli • 01:00:09

Okay, and can I, can I ask Aileen in case if you have any spots for meeting like earlier, not once in 2 weeks, but maybe Victoria will finish the documents fast so we can meet?

Moish Tov • 01:00:23

Okay, yes, ask her that the meeting will be once a. Okay, okay.

Olga Kubli • 01:00:32

Thank you.

Moish Tov • 01:00:33

Okay, thank you so much. Thank you very much. Thank you, thank you, thank you for helping.

Olga Kubli • 01:00:40

Yeah, have a good day, mate.

Moish Tov • 01:00:42

Bye.

Olga Kubli • 01:00:42

Thank you. Bye.
